HOW TO USE THIS CATALOG

Our part numbering system makes it easy to get the right part the first time. Take a minute or two to understand our cataloging concept.

Each differential has a Differential Series Code printed at the bottom corner of each illustration.

Each item has an illustration number.

The basic part number is created by combining the Differential Series Code with the illustration number. The variation suffix denotes variations within the part.

Example – 763A730M

763A	**730**	**M**
Ford 9.0" (Differential Series Code)	Ring and Pinion (Illustration Number)	3.89 Ratio (Variation)

NOTE

If an illustrated item does not list our part number, please contact your sales representative for product assistance.

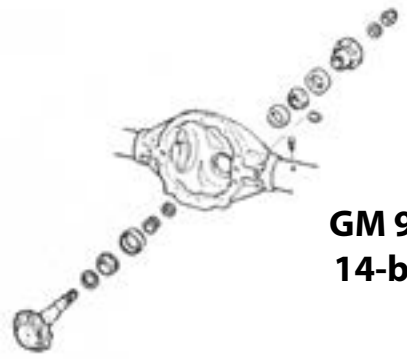
GM 14-BOLT IDENTIFICATION*

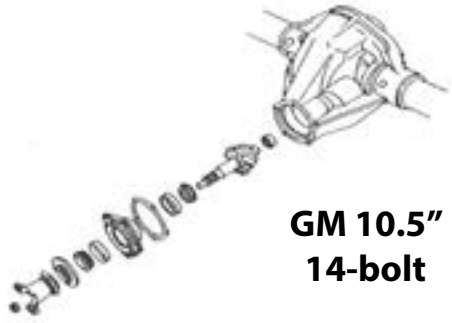
GM builds two sizes of rear axle assemblies that are commonly called 14-bolt (due to the number of bolts holding the cover in place).

9.5" (Semi-Floating) is an integral pinion design and can be identified by the more egg-shaped 14-bolt cover plate, and the pinion is removed through the rear cover plate.

10.5" (Full-Floating) is a removable pinion design and can be identified by a cover plate with straight sides and sharper corners, and by the 6-bolt removable pinion support, which allows the pinion to be removed from the front of the housing without touching the rear cover plate. Also identified by Full-Floating Axles.



GM 9.5"
14-bolt



GM 10.5"
14-bolt

**** In 2001 GM introduced an 11.5" differential with a 14-bolt cover. See Differential 745A.***

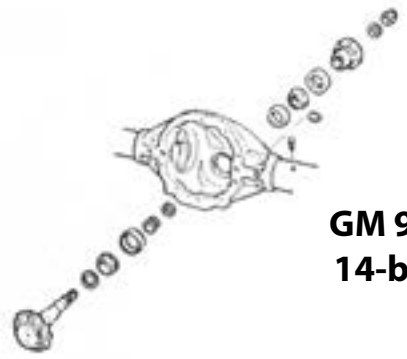
GM 14-BOLT IDENTIFICATION*

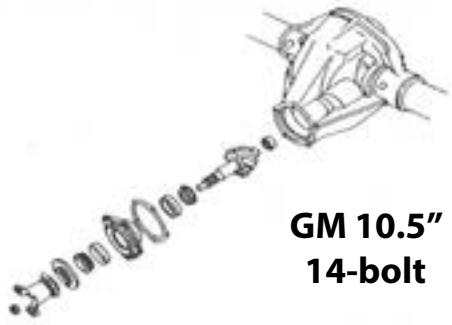
GM builds two sizes of rear axle assemblies that are commonly called 14-bolt (due to the number of bolts holding the cover in place).

9.5" (Semi-Floating) is an integral pinion design and can be identified by the more egg-shaped 14-bolt cover plate, and the pinion is removed through the rear cover plate.

10.5" (Full-Floating) is a removable pinion design and can be identified by a cover plate with straight sides and sharper corners, and by the 6-bolt removable pinion support, which allows the pinion to be removed from the front of the housing without touching the rear cover plate. Also identified by Full-Floating Axles.



GM 9.5"
14-bolt



GM 10.5"
14-bolt

**** In 2001 GM introduced an 11.5" differential with a 14-bolt cover. See Differential 745A.***

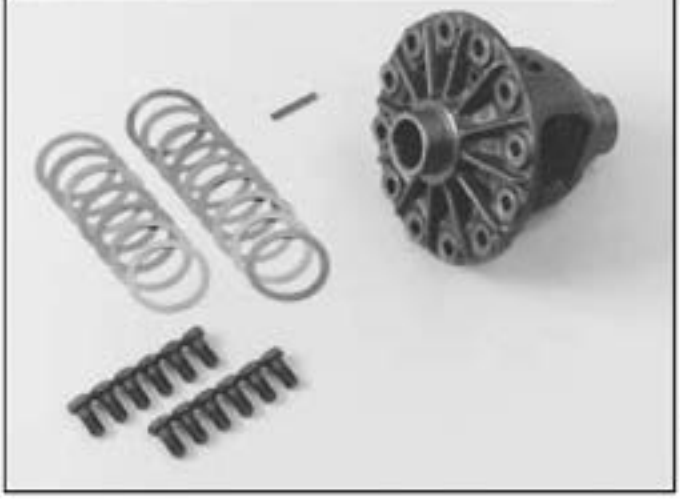
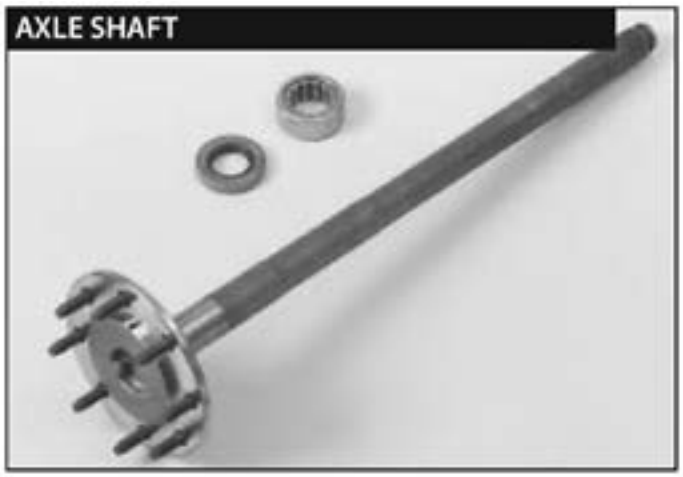
DANA BRAND KITS ONLY

EACH DANA SPICER KIT CONTAINS:

DIFFERENTIAL CASE EMPTY



AXLE SHAFT



DIFFERENTIAL CASE LOADED

CROWN & PINION KIT

DIFFERENTIAL CARRIER COVER KIT

INTERNAL NEST KIT (NON-POSI)*

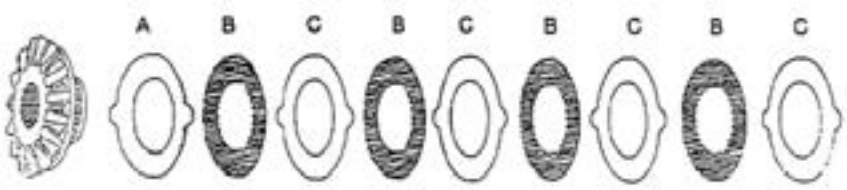
**** POSI KIT INCLUDES CLUTCH PACK***

DANA SPICER

IMPORTANT INSTALLATION INSTRUCTIONS

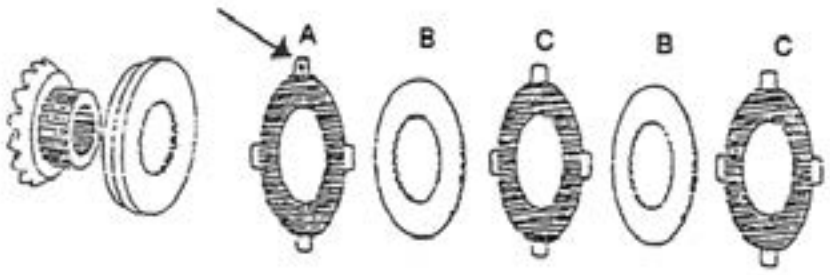
The plate and disc kits for Model 60 Track-Lok and Model 60 & 70 POWR-LOK must be installed with the proper sequence and stack height The thickness of the clutch pack is preselected and wire tied together in the kit for your convenience. Any mixing or deviation from this arrangement will cause improper blasing action of the differential case assembly. Refer to the item letter in the exploded drawing for proper disc and plate arrangement.

MODEL 60 TRAC-LOK



ITEM	MODEL 60 TRAC-LOK
A.	One dished preload spacer with ears. **NOTE: Assemble with I.D. in contact with side gear.**
B.	Four friction discs with no ears.
C.	Four differential pressure plates with ears.

MODEL 60 & 70 POWR-LOK



ITEM	MODEL 60 & 70 POWR-LOK
A.	One plate assembly with ears. **NOTE: This plate has a small hole in one ear and is to be assembled next to gear.**
B.	Two dished differential discs. **NOTE: Assemble with I.D. positioned in contact with outer plates (C) as shown.**
C.	Two differential plates with ears.

SPICER DRIVETRAIN COMPONENTS

— Courtesy Dana Spicer

IMPORTANT SERVICE INFORMATION

LIMITED-SLIP DISC & PLATE KIT

STEP	LIMITED-SLIP DISC & PLATE KIT
1	Prior to assembly, pre-lubricate each disc and plate with Friction Modifier by pre-soaking to a minimum of 20 minutes. **NOTE: The thickness of the clutch pack is pre-selected and wire tied together and must not be mixed.**
2	After assembly into carrier housing, fill axle assembly with proper amount and specified lubricant, and add remaining amount of Friction Modifier used in pre-soaking.

NOTE

It is not our intent to recommend any particular brand or make of lubricant. However, the lubricant should be an S.A.E. 80W–90 per Mil. Spec. L-2105-C, unless otherwise recommended by the vehicle manufacturer. Motor vehicles are operated under various requirements, conditions, and environments. It is recommended that the lubricants specified by the vehicle's manufacturer be used. They may provide additional lubricating characteristics which may be required for your vehicle's operation. Contact your local service dealer or refer to your owner's manual to obtain the proper lubricant specification.

DANA SPICER

How To Identify A Spicer Axle

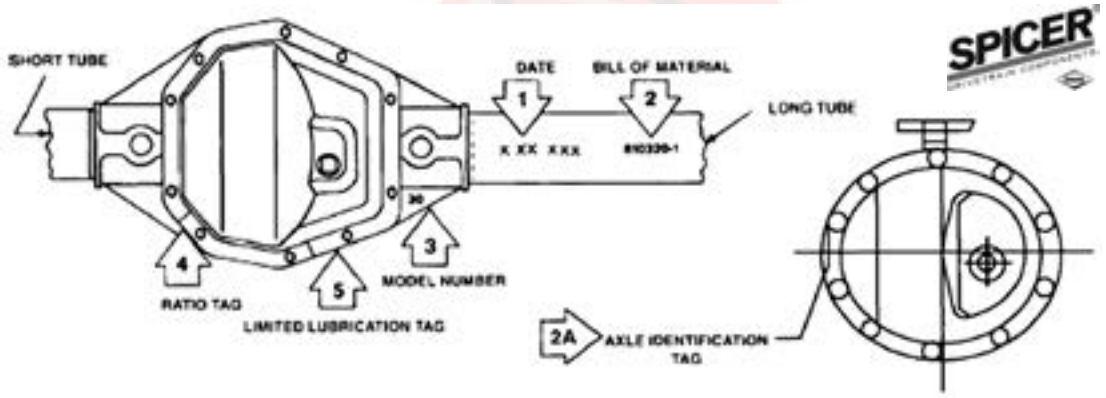
All Spicer Carrier Type axles are identified with a manufacturing date (1) and Bill of Material number (2) stamped on the right or left hand tube on driving axles. The Bill of Material number may also be found on the carrier in some models as shown in illustration (2a). For independent front suspension (IFS) axles, the B/M number may be located at one of three locations:

1. a vertically positioned tag near the center of the right hand side support arm,
2. stamped into the left hand side support arm (opposite end of the camber adjuster),
3. stamped into the 'nose end' of the axle carrier. The location will depend on the manufacturing date of the axle.

The axle model number will be cast into one of the webs as shown (3), or it can be on the nose.

Each axle contains a gear ratio tag (4), and if the axle is equipped with a limited slip differential, it will have a tag… specifying the type of limited slip lubricant to be used (5).

Refer to the appropriate model number section for parts identification and a breakdown of the Bill of Material.



How Limited Slip Differentials Operate

A conventional differential transmits all the ring gear torque through the differential gears to the axle shafts. Torque is at all times equal on the axle shafts, and if one wheel slips, the other wheel can only put out as much torque as the slipping wheel.

The Spicer Limited Slip differential has the same power flow as a conventional differential, plus a more direct flow which automatically takes effect as driving conditions demand. This more direct power flow is from the differential case to each axle shaft through a clutch plate and disc arrangement.

Arrangement of these plates and discs is at the option of the vehicle manufacturer, so care should be taken during disassembly to note the arrangement of these components.

The Limited Slip construction permits differential action when required for turning corners and transmits equal torque to both wheels when driving straight ahead. However, when one wheel tries to spin due to leaving the ground, or hitting a patch of ice, etc., the clutch packs automatically provide more torque to the wheel which is not trying to spin.

The Limited Slip differential resists wheel spin on bumpy roads and provides more pulling power when one wheel tries to slip. In many cases of differences in traction, pulling power will be automatically provided until both wheels start to slip.

In diagnosis of vehicle operators' complaints, it is important to recognize two things.

1. If, with unequal traction, both wheels slip, the Limited Slip Differential has done all it can possibly do.
2. In extreme cases of differences in traction, the wheel with the least traction may spin after the Limited Slip has transferred as much torque as possible to the non-slipping wheel.

— Courtesy Dana Spicer

COMMON CARRIER BEARING PRELOAD SHIM THICKNESSES

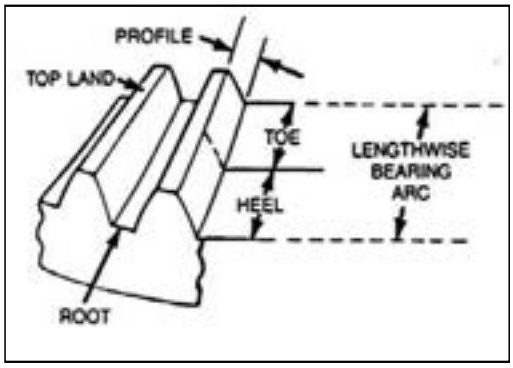
Add this amount to pre-load the bearings after determining the 'zero pre-load' thickness of the carrier bearing shim pack with the correct backlash.

Dana 30	**.015 in.**
Dana 44 beam, F&R	**.015 in.**
Dana 44 ICA	**.010 in.**
Dana 60, 70, 80	**.015 in.**
Ford 7.5, 8.8, 9.75, 10.25, 10.50	**.012 in.**
GM 7.5, 7.63, 8.0, 8.2, 8.5, 8.6	**.010 in.**

DANA TIP – **"Most people are reluctant to really crank on the pre-load adjusters with a differential that uses them. It's very important to obtain good pre-load to avoid damage from high torque loads that cause ring gear deflection. It's perfectly normal to have 150–200lbs-ft of torque on the side adjusters. Housings always deflect, so applying a heavy pre-load also pre-loads the housing, which also reduces the amount of gear deflection under load."**

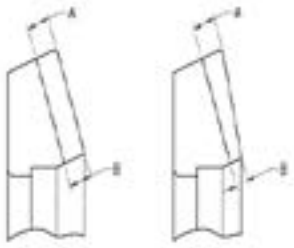
RING GEAR
TOOTH PATTERN INTERPRETATION

The final pinion position will be verified by using the GEAR CONTACT PATTERN METHOD described as follows:



The TOE of the gear is the portion of the tooth surface at the end towards the center. The HEEL of the gear tooth is the portion of the tooth surface at the outer-end. The TOP LAND of a gear tooth is the surface of the top of the tooth. Every gear has a characteristic pattern.

RING GEAR TOOTH PROFILE



FACE HOBBING **FACE MILLING**

There are two types of gears which are determined by the machining method. One is manufactured by FACE HOBBING, while the other one is manufactured by FACE MILLING. You must first determine the type of gear that you have in order to know which gear pattern chart to use as described in this bulletin. To do this, notice the depth of the ring gear tooth - dimension "A" and "B". If the gear was manufactured using the FACE HOBBING method, both "A" and "B" will be of equal depth. If the gear was manufactured using the FACE MILLING method, "A" will be larger than "B". Once the type of ring gear machining method has been identified, refer to the proper gear pattern chart.

NOTE: WHEN MAKING CHANGES, NOTE THAT TWO VARIABLES ARE INVOLVED. EXAMPLE: IF YOU HAVE THE BACKLASH SET CORRECTLY TO THE SPECIFICATION AND YOU CHANGE THE PINION POSITION SHIM, YOU MAY HAVE TO READJUST THE BACKLASH TO THE CORRECT SPECIFICATION BEFORE CHECKING THE PATTERN. REFER TO PATTERN INTERPRETATION.

- Compliments Dana Spicer

RING GEAR PATTERN INTERPRETATION

FACE MILLING

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		**Desirable pattern**. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None
	Top heel contact		**Top toe contact**	Backlash correct. Thicker pinion position shim required.
	Root toe contact		**Root heel contact**	Backlash correct. Thinner pinion position shim required.
	Top heel contact		**Top heel contact**	Pinion position shim correct. Decrease backlash.
	Root toe contact		**Root toe contact**	Pinion position shim correct. Increase backlash.

FACE HOBBING

DRIVE SIDE HEEL TOE	CONDITION	COAST SIDE TOE HEEL	CONDITION	ACTION REQUIRED
	Desirable pattern. The drive pattern should be centered on the tooth. There should be some clearance between the pattern and the top of the tooth.		**Desirable pattern**. The coast pattern should be centered on the tooth, but may be slightly toward the toe. There should be some clearance between the pattern and the top of the tooth.	None
	Top toe contact		**Top heel contact**	Backlash correct. Thicker pinion position shim required.
	Root heel contact		**Root toe contact**	Backlash correct. Thinner pinion position shim required.
	Top heel contact		**Top toe contact**	Pinion position shim correct. Decrease backlash.
	Root toe contact		**Root heel contact**	Pinion position shim correct. Increase backlash.

- Compliments Dana Spicer

To Determine Ring Gear Diameter

To determine the ring gear diameter you need to measure the outside diameter of the ring gear.

To Determine Gear Ratio

Count the number of teeth on the pinion gear and count the number of teeth on the ring gear. Divide the ring gear teeth number by the number of teeth on the pinion. The result is your gear ratio.

EXAMPLES

41 teeth on ring gear	41 teeth on ring gear	40 teeth on ring gear
10 teeth on pinion	12 teeth on pinion	13 teeth on pinion
41/10 = 4.10	41/12 = 3.42	40/13 = 3.08

Note: you may need to round off the number.

TORQUE SPECIFICATIONS

RING GEAR BOLTS – GRADE 8

3/8" x all lengths	45-50 ft lbs.
7/16" x all lengths	60-65 ft lbs.
1/2" x all lengths	100-110 ft lbs.

CARRIER CAP BOLTS

7/16" (5/8" head)	60-65 ft lbs.
1/2" (3/4" head)	80-85 ft lbs.

Recommended Break-in

A new Ring and Pinion installation, especially a high numeric ratio with new bearings, can create an excessive heat build-up in the rear end, and cause softening of the gear teeth and bearings if a break-in is not performed.

Street vehicles should be driven at normal street driving speed for approximately 10 miles, then stop and let cool for 30 minutes. Do this 2 to 3 times. Vehicles used for towing purposes, need approximately 200 to 300 miles of normal street driving before being used for towing.

For circle track race cars, make approximately 6 to 8 laps at slow speed, then let cool for 30 minutes. Make 6 to 8 more laps at slow speed, then 2 to 3 laps at full speed, then let cool again for 30 minutes.

Drag cars need only an initial run-in since they are driven short distances, and heat is not normally a problem with proper lube and backlash allowances.

NOTE: If after the above break in is performed overheating of the rear end is suspected, repeat the final portion of the break-in procedure.

– Courtesy Richmond Gear

When selecting a Gear Ratio, you should consider the following:

1. Tire Size
2. Transmission Ratio
3. Final Gear Ratio
4. Engine RPM at Cruise Speed

The following formula has been developed to calculate the optimum final Gear Ratio to suit your application.

$$\frac{\text{M.P.H. X Gear Ratio}}{\text{Tire Diamter}} \times 336 = \text{rpm} _____$$

The chart shown below shows RPM calculations at 55 MPH for various combinations of final Gear Ratio and Tire Diameter.

	Tire Diameter

NEW STYLE

GM
Pinion Bearings

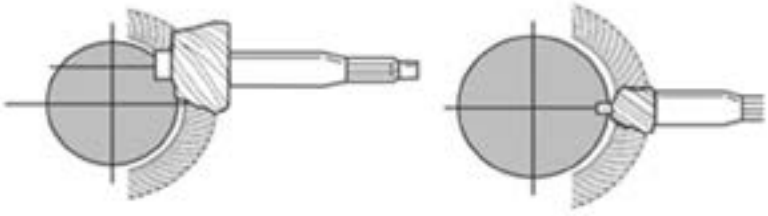
STANDARD Bearing Cone	UPDATED Bearing Cone
742G255 **(M802048)**	**742G255A** **(STD4183)**
CONE Height	**CONE Height**
26.24mm	26.49mm
CUP Height	**CUP Height**
20.15mm, M02011	17.98mm (sold as a set)

*Previously, we identified these as with or without shoulder. KOYO is now producing both with a shoulder so we must identify these bearings by number or dimension.

Updated
Pinion Yokes

The yoke on the left is the old style without any types of sleeve. The new style yoke on the right is produced by AAM and comes with a stainless steel sleeve protecting it from premature wear. This design is used on most GM 7.5”, 8.5”, 8.6”, 9.5” etc. You can use this new style in place of the old style but must sell the updated pinion seal do to the inside diameter changing.

High Pinion
and
Center Line



The pinion on the right (Spiral Bevel) shows it setup with the center line which means it is a standard rotation. The pinion on the left (Hypoid Gearset) shows the pinion above the center line. Experience technicians may order parts and tell you that he has a “high pinion” that indicates he has a reverse rotation.

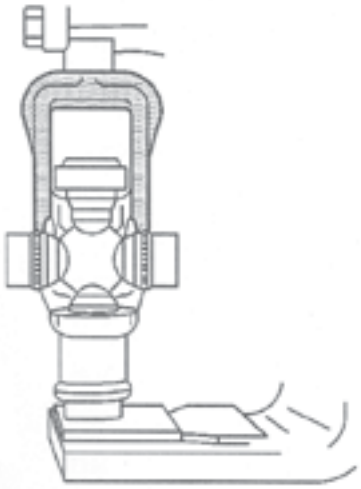
UNIVERSAL JOINT REPLACEMENT



- **Inspect U-Joint** to determine if snap rings or nylon injection is holding the bearing cups in.
- Mark orientation of part so part can be reassembled in the same position.
- If snap rings are present, remove them first.
- Support lower ear such that the bearing cup can be pressed out into a receiver.
- **Do not heat yoke.**
- **Do not try to press U-Joint through both ears.**
- Use a C-tool similar to what is shown and press the bearing cup out, one at a time.
- After all bearing cups are removed, clean the grooves where the new snap rings will be installed.
- Start one bearing cup assembly into the yoke, install the cross, being careful that none of the needles move out of position during installation. Install bearing cup to the start of the snap ring groove (final press will be done after both bearing assemblies are in place).
- Turn assembly 180 degrees and install the other bearing cup assembly.
- Now press bearing assembly so the snap ring can be installed and repeat for the other side.
- Make sure snap rings are seated in position. The cross should be able to rotate.

DRIVESHAFT BALANCING

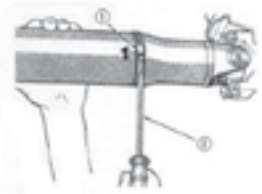


FIG 1

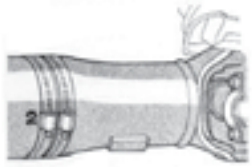

FIG 2

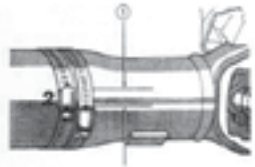

FIG 3

- **If driveshaft is suspected of being out of balance,** check for missing balance weights, broken welds and any build-up of dirt or paint that could cause the driveshaft balance to be affected.
- Inspect U-Joint and clamps for wear or looseness, replace if required. If the driveshaft is bent, it will have to be replaced.
- To field balance a driveshaft, raise vehicle parallel to the ground so that the vehicle can be started, and the tires and wheels can rotate freely.
- Measure about six inches from the yoke end, and place four marks 90 degrees apart around the driveshaft. Number them so that they can be identified.
- Run vehicle and note vibration intensity and speed when vibration occurs.
- Place a screw type hose clamp at the first position. (See FIG 1)
- Run vehicle to see if vibration changed, if not rotate the clamp so the screw is at the next mark on the driveshaft.
- If after positioning the clamp at all four positions, the vibration is not changed, the vibration may not be the driveshaft.
- Run vehicle, repeat until vibration seems to be reduced. Install a second clamp and test again to see if vibration is reduced. (See FIG 2)
- If second clamp causes an increase of vibration, separate the clamp screws about $^{1}/_{2}$ inch (See FIG 3), and repeat test. Increase distance until vibration is at the lowest.
- Make sure the clamps are tight, and bend the loose end so that the screw will not loosen.

– Compliments American Axle & Manufacturing

Performance Differentials

Posi™

- Carbon Friction Technology
- Precision-Forged Gears
- Automatic
- Rebuildable

The Eaton Posi is the perfect way to control traction in street rods, light duty pickups and everyday drivers.

The Eaton Posi prevents wheel slip before it can get started. To do that, carbon disc clutch packs, preloaded by a central spring assembly, are located behind each differential side gear. When torque input increases the clamping load on the clutch packs increases. That causes the chatter-free clutch packs to grab and transfer power to the other wheel. The Eaton Posi is fully rebuildable with one of our specially formulated clutch kits.

Muscle cars, hot rods and mild off-road vehicles should look to Eaton's limited-slip differential for their traction answers. And the fact is, Eaton's Posi units are virtually bulletproof.

- Helical Gear
- Torque Biasing
- Smooth & Automatic
- Maintenance Free

Eaton's Detroit Truetrac was the first helical gear differential ever introduced into the automotive aftermarket. It remains the leading gear-type limited slip differential in the industry. Detroit Truetrac's proven design eliminates the need for wearable parts, resulting in maintenance free traction. Recognized not only for its durability but also it's smooth and quiet operation.

Engineered to work efficiently in front and rear axles, semi-floating (C-clip axles) and transfer cases. Power transfer is so smooth, it literally goes unnoticed by the driver - even in front wheel drive axles.

Proven design and effective performance, all make the Detroit Truetrac limited slip differential the ideal choice for a wide variety of vehicle applications.
No maintenance - Just Traction!

ELocker™

- Push Button
- Maintenance Free
- Driver Controlled
- Serviceable

The ELocker's electromagnetic locking mechanism is the next generation of aftermarket differential technology. Performs as an open differential until you decide that you need more traction. Eaton ELocker is your push button solution to almost any traction problem.

Designed expressly for 4-wheel drive systems to give you the ability to lock or unlock the differentials when necessary. When locked the Eaton ELocker performs as a full locker, capturing 100% of available torque and sending it equally to both ends of the axle.

The ELocker is built with precision-forged gears that are designed to mesh perfectly, providing improved strength and durability over a standard cut gear. Its ease of installation, reliability and push-button activation make ELocker an absolute must for all traction and off-road performance applications.

- 100% Automatic Locking
- Wheel Speed Sensitive
- Legendary Traction
- Unmatched Durability

The legendary Detroit Locker began the revolution in performance differentials and still leads the industry today as an Eaton brand. The Detroit Locker is the most durable and dependable locking differential available.

The Detroit Locker maximizes traction by delivering 100% of the torque to both drive wheels. It is engineered to keep both wheels in a constant drive mode, and has the ability to automatically allow wheel speed differentiation when required. Applications are also available for C-Clip style axles.

No other performance differential has the reputation for delivering traction in mud, snow, rocks and on the track. The choice of professional racers and off-road enthusiasts around the world! The durability of the Detroit Locker is unmatched!

For axles with large bearing bores (race O.D. of 3.06"), usually found on vehicles from 1999 to present, bearing LM603049 and race LM603012 are required.
(a) 225S10 differential replaces the conventional differential internals used in certain 1973 thru present GM axles. If it is to be installed in a GM axle equipped with an optional Eaton differential, it will also be necessary to purchase a new gear support case assembly, GM #6258336 or #6258340, depending upon gear ratio.
(rgbl) Requires ring gear bolt - GM part #12479387

Circle Track Racing Applications

Ford 9" CTR only	1.32"	31	All exc. 2.72	R18703A	
Ford 9" 2.00 Large Bearing	1.32"	31	All	R18715A (was R18707A)	
Quick Change (Franklin, Halibrand, Richmond, Winters, etc.)					
CTR only	1.32"	31	All	R18705A (aluminum housing)	

The Detroit Locker CTR (Circle Track Racing) version of the Detroit Locker is made exclusively for left hand turn racing only. Designed for use of asphalt or concrete tracks being ½ mile or larger.

INDEPENDENT TESTING OF DIFFERENTIALS - check it out at EatonPerformance.com

Independent Testing Firm, National Technical Systems, tested a group of Eaton's differentials along with competitor's differentials. The baseline for testing was established using Eaton's differentials. All differentials were held to the same exact parameters during testing. According to the test results, NTS has determined,

"Eaton differentials outperformed the competitor's differentials nearly two to one."

NOTES

(+) +4.56, 4.88 and 5.13 require some modification for install.

(1) "dia. r.g." is the pitch diameter of the ring gear. "10 bolt" means number of bolts in the differential housing cover.

(2) The axle shaft diameter is the "major diameter" measured over the splines at the outer end of the shaft.

(3) "& up" after the ring gear/pinion ratio means that all numerically higher ratios, in addition to the one designated, are also accommodated.
"& dn" after the ratio means that all numerically lower ratios are accommodated.

(4) A "letter" after the model indicates a two-piece differential support case is supplied by Eaton with the differential. All other models (no letter) fit the two-piece differential case supplied by the axle/vehicle manufacturer. Bolts, bearings, shims & gaskets are not supplied.
The "Detroit SofLocker" differential indicated by an "SL" in the model number (187SL16D), provides smooth and reduced noise operation in the drive-coast mode. A dampening device has been inserted into the inboard end of each side gear.
The "Detroit C-Locker" differential indicated by a "C" in the model number (187C149A), accommodates axles with C-Clip axle shaft retainers inside the differential.

(5) Detroit Locker differentials should not be used in front-drive axles or light on-highway vehicles unless used with unlocking hubs that are fully unlocked on-highway.

(6) Dana 61-1 FULL FLOAT 1.31" dia. r.g./30 axle spline:
3.31 & down ratios, use Detroit SofLocker 225SL19B

3.54, 3.73, 4.10 ratios, THIN RING GEAR with standard differential;

Number on ring gear is:	32503 = 3.54 ratio	
	34508 = 3.73 ratio	Use Detroit SofLocker 225SL19C
	30360 = 4.10 ratio	

3.54, 3.73, 4.10 & 4.56 ratios, THICK RING GEAR with limited slip differential;

Number on ring gear is:	39211 = 3.54 ratio	
	37875 = 3.73 ratio	Use Detroit SofLocker 225SL19A
	39300 = 4.10 ratio	
	39299 = 4.56 ratio	Use Detroit SofLocker 225SL19C

(7) Dana 70/70 HD, 35 splines: Use Detroit Locker 225S-18 if two piece case; use 225SL58 A, B, C, D if a one piece case.

For Drag Racing applications:
When using a Locker with trans brake - take the lash out of the Locker before pre-staging.

HOW TO USE THE CATALOG

	Year	Application	Length	Code	Type	Part
(1)	**GMC**					
(2)	**HUMMER**					
	2010-06	Front H3	23 5/8"	W	A29	**9492**
	(3)	**(4)**	**(5)**	**(6)**	**(7)**	**(8)**

(1) Locate Manufacturer - Listed Alphabetically. Example: GMC
(2) Locate Model - Listed Alphabetically. Example: Hummer
(3) Locate Year. Example: 2010-06
(4) Locate Application. Example: Front H3
(5) Confirm Overall Length
(6) Code - How to Measure Shaft *(See Footnote Codes on Bottom of All Pages)*
(7) Type of Shaft *(See Footnote Codes on Bottom of All Pages)*
(8) Locate Part Number. Example: 9492

Whenever necessary, footnotes and illustrations are used to clarify catalog listings. Each application listing will show a TYPE number to refer to in the application. The photos can be found on pages V through VII. Your shaft should closely match the photo shown. If not, please contact the technical information department for assistance.

GENERAL INFORMATION

All shaft assemblies are remanufactured not rebuilt to ensure a long and trouble free service life. All shaft assemblies are completely disassembled, cleaned and inspected. Only those components that meet the original OEM specifications are reused. All other components are replaced with new or OEM specific remanufactured components. All shafts are re-assembled with new universal joints and CV centering kits with grease fittings and are then completely greased with the proper lubricant. Remember, *Grease is the life of the shaft.*
All shafts are straightened and computer balanced and tested to closer tolerances than OEM specifications and than 100% inspected after final assembly and balancing.

MEASURING A DRIVE SHAFT

To properly measure a drive shaft, the shaft should be compressed to the shortest possible length. Most typical shafts are measured from the center of the U-Joint, located at the slip yoke end to the center of the furthest U-Joint on the opposite end of the shaft. In addition you may need to measure the size of the U-Joint by measuring across the slip yoke ears.

CODES:

B Centerline of U-Joint located at the slip yoke end to centerline of the rear (furthest U-Joint) on the opposite end of prop shaft. Prop shaft must be collapsed.

C Face of flange to face of flange. Shaft must be collapsed. Some applications have a flange on one end only. Measure face of flange to centerline of rear U-Joint.

W Tube length only. Measure centerline of weld to centerline of opposite weld.

* New Number. Limited core supply may restrict availability.

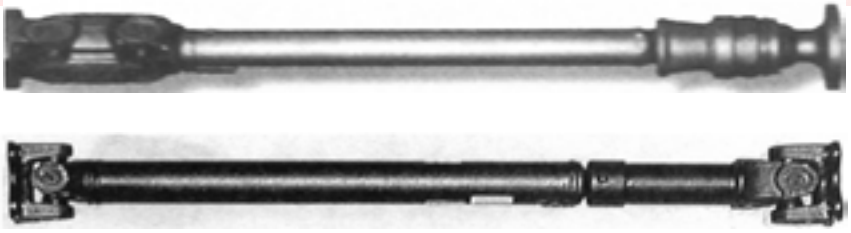
Original Design - Ford Bronco II (GKN Design)



Our replacement design shaft is a Conven. type drive shaft using a spline and slip yoke design with replaceable U-Joints. All driveshafts are balanced up to 3500 RPM's.

W250	3/4 ton Dodge truck 4WD
W2500	3/4 ton Dodge truck 4WD
W300	1 ton Dodge truck 4WD
W350	1 ton Dodge truck 4WD
W3500	2 ton Dodge truck 4WD
WJ	Grand Cherokee
XJ	Cherokee
XJ	Comanche
YJ	Wagoneer up to 1996
YJ	Wrangler up to 1996
ZJ	Grand Cherokee

GLOSSARY OF TERMINOLOGY

Term	Description of Other Common Terms
Cage	Differential Case, Can Be Empty Or Loaded
Cardan	U Joint In a Rigid Rod That Allows The Rod To 'Bend' In Any Direction
Crown & Pinion	Ring & Pinion
Crown Bolt	Ring Gear Bolt
Crush Sleeve	Collapsible Spacer
CV	Constant Velocity
Diff. Shaft	Differential Pin, Cross Shaft
DMB	Chrysler 2.82 Axle Ratio
DMC	Chrysler Dana 30 Solid Front Axle 3.21-Up Ratio
DMD	Chrysler Dana M80 Rear Axle 3.55-Up Ratio
DME	Chrysler Dana 30 Solid Front Axle 3.73-Up Ratio (Conventional Diff. Front Axle)
DMF	Chrysler Dana 44 Hd Front Axle 4.10-Up Ratio (Tru-Lok Front & Rear Axles)
DMH	Chrysler 3.92 Rear Axle Ratio
DML	Chrysler 245mm Rear Axle
DMM	Chrysler Rear, Dana M35, 194mm
DMN	Chrysler 200mm Front Axle 3.07-Up Ratio
DMT	Chrysler Rear Axle - Dana M44 / 216mm RBA
DMW	Chrysler 2.87 Axle Ratio
DRQ	Chrysler 11.50 Rear Axle 3.73-Up Ratio (Anti-Spin Differential Rear Axle)
DRW	Dual Rear Wheels
DRX	Chrysler 11.50, Dual Wheels Rear Axle
DS8	Chrysler 11.50 Rear Axle 3.42-Up Ratio (Conventional Differential Rear Axle)
DSA	Dual Wheels Rear Axle 4.10-Up Ratio (Anti-Spin Differential)
DWD	Dual Wheel Drive
ECTED	Auburn Electronic Activated Rear Differential
EDL	Electronic Differential Lock
ELSD	Electronic Limited Slip Differential
GT4 Option	General Motors Option Code
GT5 Option	General Motors Option Code
GTY Axle	General Motors Option Code "Wide Trac"
GU6 Option	General Motors Option Code
IFS	Independent Front Axle
Internal Kit	Internal Nest Kit, Inner Parts Kit, Spider Kit, Case Kit, Differential Case Kit
IOP	Integrated Oil Pan
Lock Screw	Shaft Lock Screw, Pinion Shaft Lock
Non-Posi	Non Positive Traction, Also Open, Standard, Non-Locking
OAL	Overall Length
Plenum	Axle Housing End
Posi	Positive Traction Rear Axle
Powr Lok	Dana Proprietary Limited Slip Posi (Clutch And Ramping Engagement Process)
Ring & Pinion	Crown & Pinion
Ring Gear Bolt	Crown Bolt
SDX	Chrysler 215mm Rear Axle 3.06-Up Ratio
SRT	Chrysler Street & Racing Technology (Commonly Called Srt)
SRT8	Chrysler Street & Racing Technology 8 Cyl (Commonly Called Srt)
SRT10	Chrysler Street & Racing Technology 10 Cyl (Commonly Called Srt)
SRW	Single Rear Wheel
SVT	Ford "Special Vehicle Team"
SWD	Single Wheel Drive
Tone Ring	Abs Ring
Trac Loc	Dana Proprietary Limited Slip Posi (Clutch-Type Mechanical),
Tru Lok	Proprietary Posi Axle(Gear-Type Mechanical),
Vari Lok	Jeep Proprietary Posi Axle(Gerotor Pump)
